## ABSTRACT:

PURPOSE: To attain the communication between optional equipments through a time division multiplex packet exchange system ring type LAN by generating a frame format suitable for the external designation so as to use a frame of the frame format. voice system voice system with

CONSTITUTION: A phase synchronizing oscillator 74, a synchronization frame generating means 75, and a frame detection means 76 are provided to the system. Then a synchronizing frame is generated based on an output signal of a phase locked oscillator 74 oscillated in phase locking with a master clock of a ring type LAN (Local area network) and an external setting value. Thus, the frame transmission with a format suitable for the applied system synchronously with the master clock is attained by selecting the setting value and correct frame detection is attained by detecting the voice synchronizing frame based on the output signal of the phase locked oscillator 74 from the data sent via the ring type LAN. Thus, the frame of the frame format is used to attain the communication of the optional voice system equipment. voice voice voice
